FAQ'S MUFFLER SHIELD KIT

How does the Muffler Shield Kit install?

The Muffler Shield kit comes with two different materials and stainless steel locking straps. You measure the muffler dimensions and then cut both materials to the same size. The insulation layer wraps around the muffler, then the aluminum material layer goes on top of that. They are both then secured with the included stainless steel straps.

Is there enough material to do two mufflers in one kit?

It depends on the size of your mufflers. The two aluminum reflective layer measures 42" x 24" and the insulation measures 51" x 24", plus 4 - 40" stainless steel straps. You will need to determine the size of your mufflers and determine if there is enough material on one kit for your application.

Can I wrap my headers with the muffler shield material?

No. Temperatures of headers are much higher typically than mufflers. You will need to use exhaust wraps to reduce temps from headers and other exhaust pipes.

Can I just use Floor and Tunnel Shield as a Muffler wrap?

No. In Floor and Tunnel Shield there is an adhesive layer that bonds the two materials together. If you use that on a hot muffler, it could potentially off-gas and the adhesive may smolder.
